DETAILED ACTION

Claim Objections

Claim 1 is objected to because of the following informalities: Claim 1 as filed contains conversational notes inapplicable to the claim language. Applicant is hereby advised to delete these notes from the claim language. Examiner will proceed by ignoring these notes and examining the claim on its merits. Appropriate correction is required.

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claim 1 is rejected under 35 U.S.C. 102(e) as being anticipated by Yi et al. (U.S. Patent Application Publication No. (US 2002/0015385).

Reference Yi teaches: a method for confirming receipt of protocol data units (PDU). The method includes a window-based polling procedure that has been modified to perform polling only during specified conditions to reduce undesired polling (see page 1, [0013], and page 3, [0028] of Yi). Yi also discloses that the determination whether to perform polling is operated by comparing a value of an RLC PDU, where a send state variable VT(S) is incremented by one after each RLC PDU is transmitted. The value

VT(MS) represents a maximum send status variable that represents the sequence number of the PDUs not subjected to be transmitted. Maintaining a record of the PDU sequence numbers provides a method for determining if a PDU has been retransmitted. The value of VT(S) increasing by one after each PDU has been transmitted in combination with a comparison with the value of VT(A) (an acknowledge state variable representing the number of the first PDU)) provides a method for only causing polling to be triggered if a PDU is not a re-transmitted PDU (see page 2, [0025-0028] of Yi). Also, the polling is only operated when the polling determination method indicates that polling is to be triggered (see page 3, [0028] of Yi).

Allowable Subject Matter

Claims 2-4 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

The following is a statement of reasons for the indication of allowable subject matter: Claim 2 recites:

“obtaining a first value that is $(2^n + 1)$ added to a difference of a parameter S and the base sequence number VT(A)”.

None of the prior art references taken individually or in combination teach this portion of claim 2. Therefore, claim 2 is allowable over the prior art.

Regarding claims 3-4, these claims are also allowable by virtue of their dependency on claim 2.
